Final Project Title	Leveraging Long Short - Term Memory (LSTM) for Stock Prediction, Anomaly Detection, and Risk Analysis in the Indian Banking Sector	
Team No	23	

ABSTRACT

Stock market prediction, anomaly detection, and **risk analysis** are essential for informed investment decisions in the banking sector, particularly with rapid technological advancements enabling accurate data analysis. This study applies the **Long Short-Term Memory (LSTM) algorithm** to analyze **stock price movements** of major Indian banks, including **State Bank of India (SBI), HDFC Bank,** and **ICICI Bank**. Stock price fluctuations are examined, and **anomaly detection** identifies unusual price movements. Based on these anomalies, **risk analysis** helps investors evaluate bank stability and risk. Furthermore, **LSTM-based stock price prediction** forecasts future prices using historical trends, enabling investors to anticipate market movements and make proactive, informed, and potentially profitable investment decisions.
